Schools likely affected

2,616

closure chance × schools, state by state · 1,213,805 students

Model estimate from hourly DOE API – confirm with official APIMS and KPM announcements.

Tomorrow morning outlook

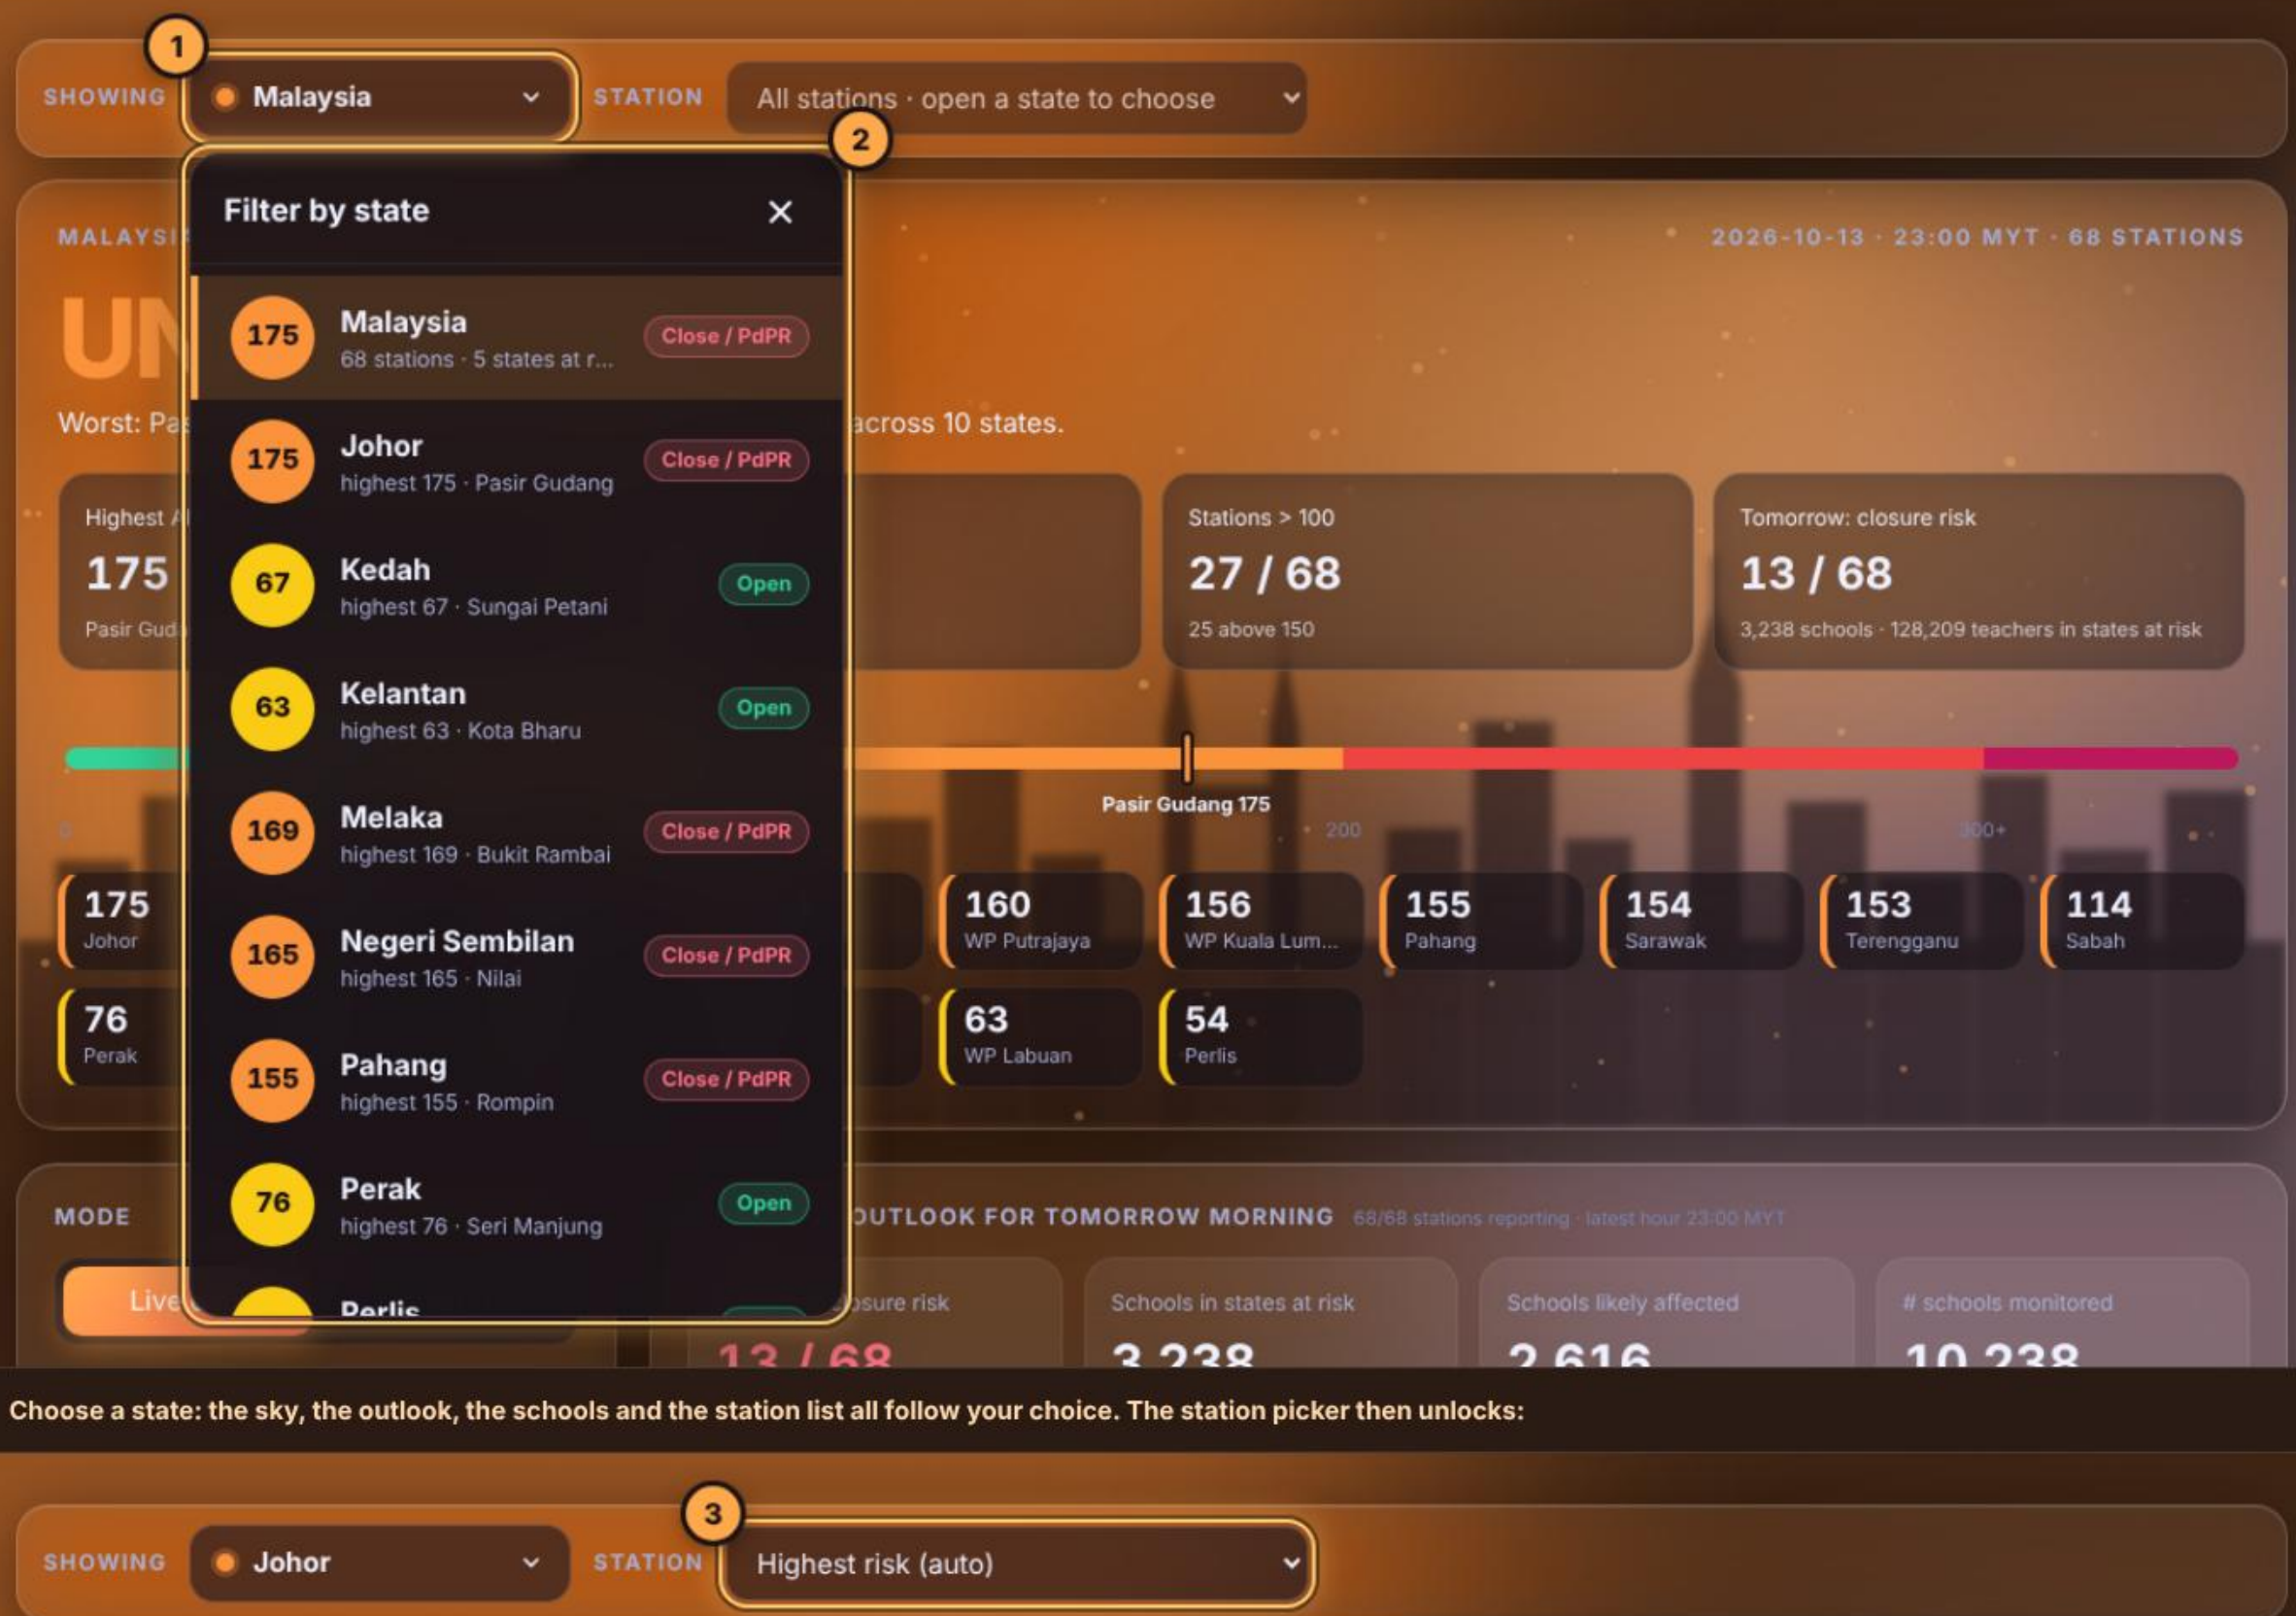

The dashboard in one screen

1. **Live badge** – green = the newest hourly DOE report is under 2 h old; amber/red = the feed is lagging or stale.
2. **Haze right now** – the sky, skyline and band name show how bad the air is across Malaysia at this hour.
3. **State tiles** – highest API per state, coloured by band. Click one to open that state.
4. **Live data / What-if** – Live follows the newest report; What-if lets you type your own readings.
5. **State filter** – the whole page follows it: "Malaysia" (all states) or one state. On a phone, use the round button at the bottom-right.
6. **National outlook** – tomorrow morning: stations at closure risk and the schools, students and teachers behind them.

STEP 2 · FILTER BY STATE

Malaysia or one state – on desktop and on your phone

Choose a state: the sky, the outlook, the schools and the station list all follow your choice. The station picker then unlocks:

On a phone the same list opens from the round button (bottom-right) as a bottom sheet:

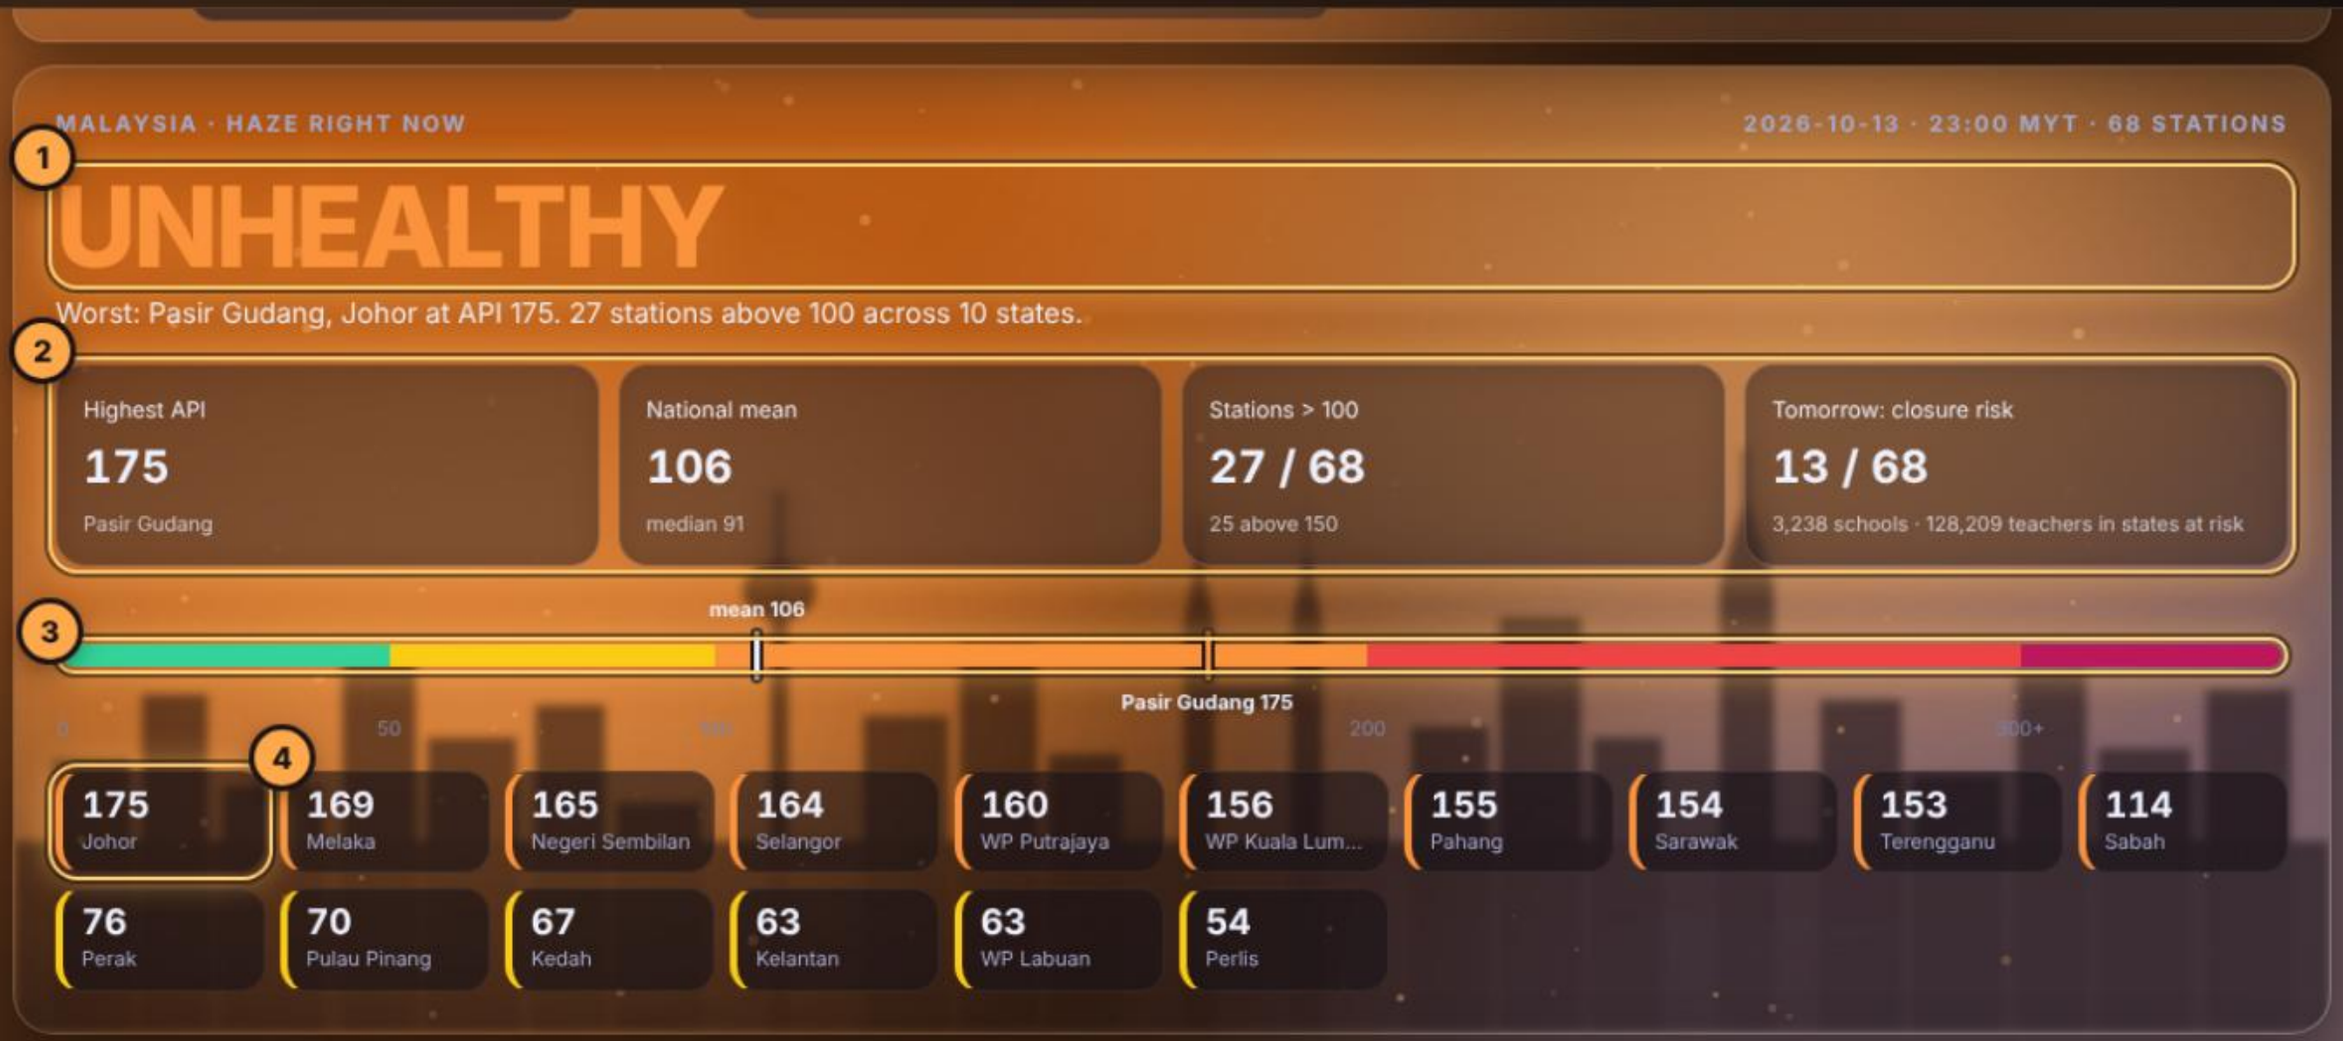

Round button stays in reach while you scroll

Tap a state; the page filters at once

1. **State button** – shows what the page is filtered to. Click it to open the list.
2. **State list** – "Malaysia" first, then every state. Each row shows its highest live API (coloured by band) and Open / Watch / Close status.
3. **Station picker** – after choosing a state, pick one of its stations or leave it on "Highest risk (auto)".
4. **Round button** (phones) – always bottom-right; opens the list.
5. **Bottom sheet** – tap a state. The link is shareable: add `#Johor` to the address.

Haze right now

1. **Band** – Malaysian API bands: Good 0–50 · Moderate 51–100 · Unhealthy 101–200 · Very unhealthy 201–300 · Hazardous 300+. The colour follows the *worst* station.
2. **Four numbers** – highest API, national mean, stations above 100 / 150, and tomorrow's closure-risk count.
3. **Band scale** – the white marker is the national mean; the coloured marker is the worst station.
4. **State tile** – the state's highest reading. The more haze, the thicker the particles and the blurrier the skyline.

National outlook and schools impacted

Click a state to open its stations. A state's closure chance is its highest-risk station; 'Stns' = stations at risk / reporting; '# schools in area' = government primary + secondary schools in the state; 'Schools likely affected' = closure chance × those schools, summed over states.

1. **Stations at closure risk** – stations whose closure probability is above the cost-optimal trigger.
2. **Schools likely affected** – closure chance × the number of schools in each state, added up (students and teachers shown underneath).
3. **Status** – Close / PdPR, Watch or Open per state, worst first. A state's chance is its highest-risk station.
4. **Click a row** to filter the page to that state and see its stations.
5. **# schools in area** – government primary + secondary schools in the state (state totals, MOE via OpenDOSM).

1

SCHOOLS IMPACTED · JOHOR

3

Schools in Johor
1,195
govt primary + secondary · +2 public universities

Students and teachers
581,184
48,876 teachers · 11.9 pupils per teacher

If schools close
1,195
schools · 581,184 students · 48,876 teachers affected

Likely affected tomorrow
989
83% closure chance × 1,195 schools

Closure chance is the state's highest-risk station (Pasir Gudang). "Likely affected tomorrow" = that chance × the number of schools in Johor; "If schools close" is the full count affected when a state-wide closure is ordered. School counts are state-level totals from OpenDOSM/data.gov.my: schools_district, enrolment_school_district, teachers_district (2025; government primary + secondary schools; IPTA public universities listed separately).

THREE SCENARIOS FOR TOMORROW MORNING

4

Best · improving
0.5%
7 AM reading ≤ 100. Announce open early; families can plan.

Base · unstable
29%
Unhealthy but below closure trigger. Open with restrictions; keep PdPR ready.

Worst · closure
71%
API > 180 in school hours, or 3rd straight day > 150. Close / PdPR.

1 **Recommendation** – open / open with restrictions / close-PdPR, with the closure ring and why.

2 **Probabilities** – 7 AM API above 100 and 150, API above 180 in school hours, and the 3-day streak rule (KPM's two closure triggers).

3 **Schools impacted (state level)** – schools, students and teachers in the state. "If schools close" = everyone affected by a state-wide closure; "Likely affected tomorrow" = closure chance × schools.

4 **Three scenarios** – best (improving), base (unstable), worst (closure). The framed one is the most likely.

3

Next-day closure forecast, skill vs base rate	3 PM	4 PM	5 PM	6 PM	7 PM	8 PM	9 PM
From the DOE feed	66%	67%	67%	66%	68%	70%	72%
From Open-Meteo alone	51%	51%	52%	51%	52%	54%	54%

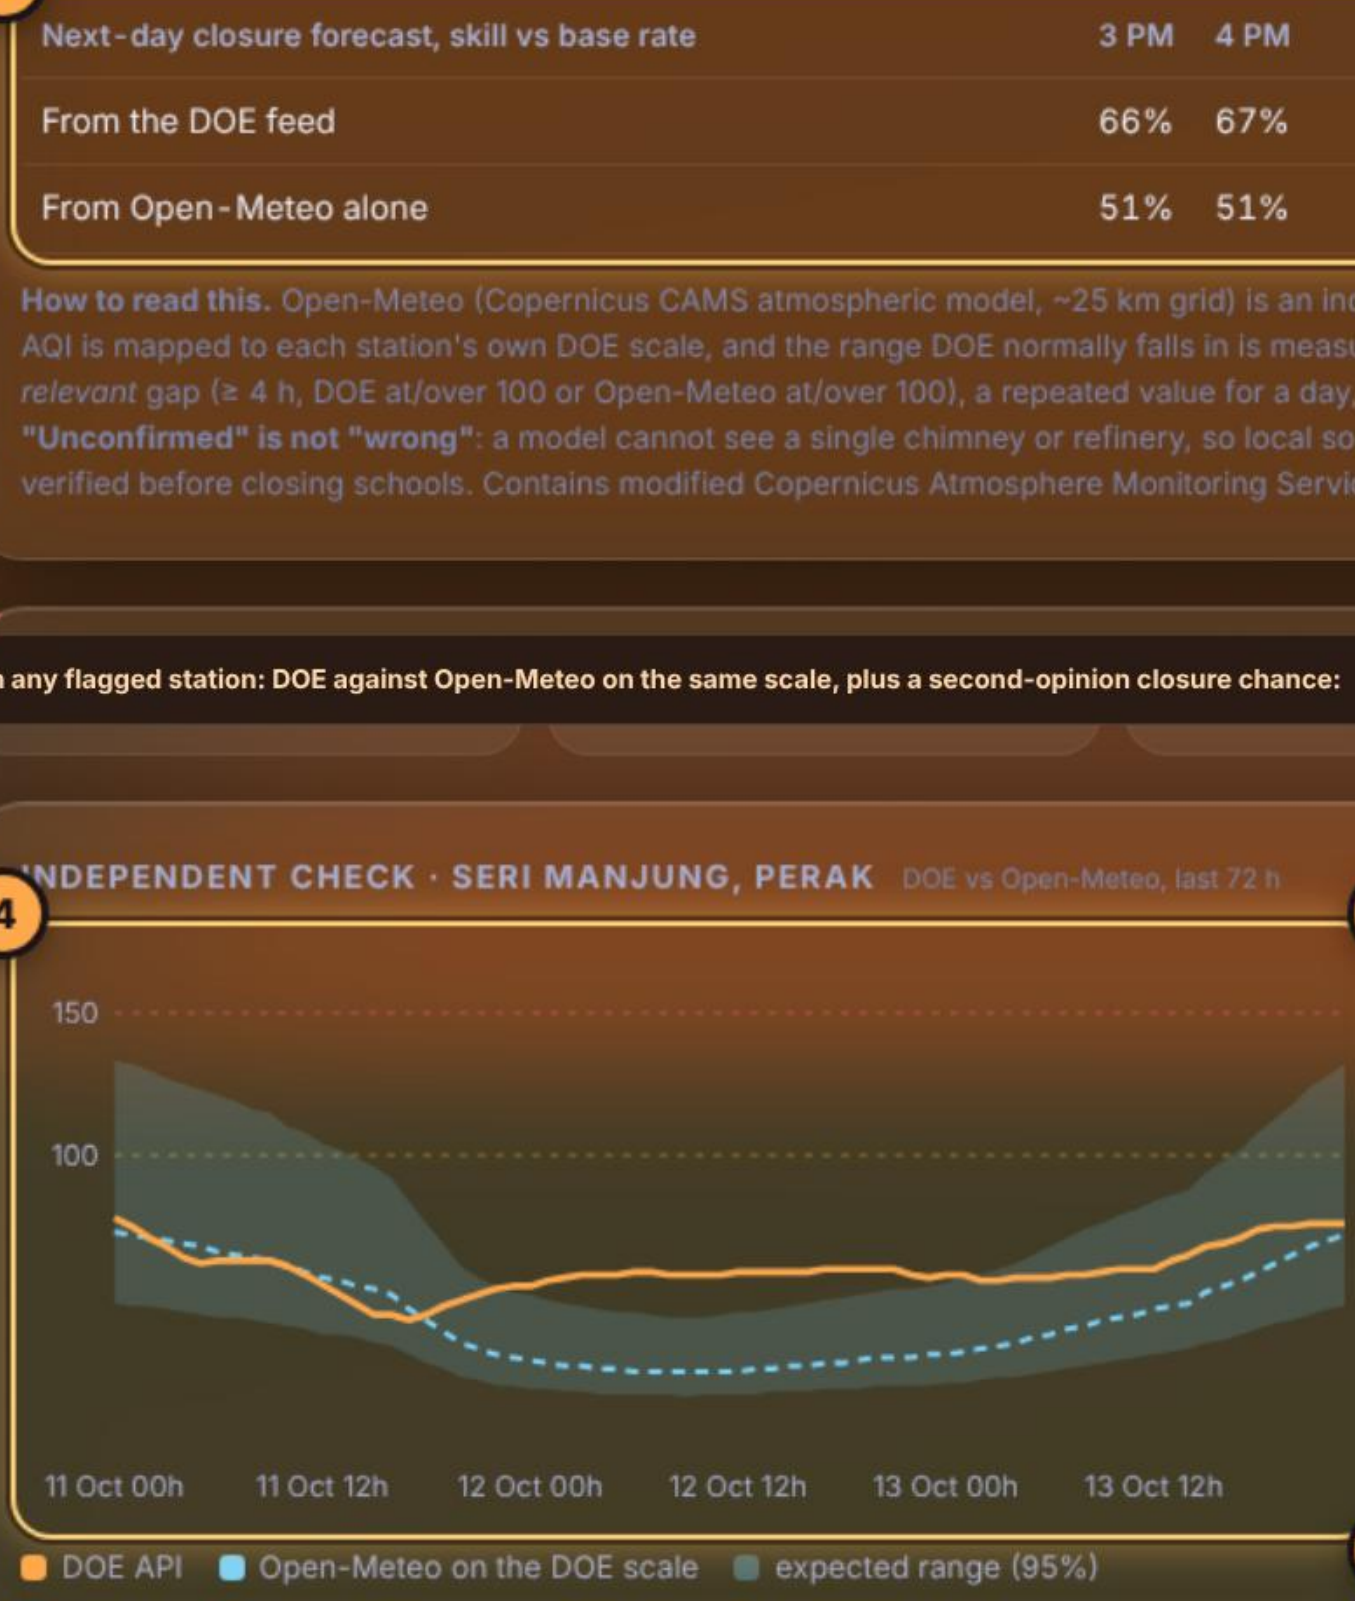

How to read this. Open-Meteo (Copernicus CAMS atmospheric model, ~25 km grid) is an independent estimate of the same air. Its 24-hour mean US AQI is mapped to each station's own DOE scale, and the range DOE normally falls in is measured from history. A flag means a *sustained, decision-relevant* gap (≥ 4 h, DOE at/over 100 or Open-Meteo at/over 100), a repeated value for a day, or a one-hour jump the other source does not share. **"Unconfirmed" is not "wrong"**: a model cannot see a single chimney or refinery, so local sources look unconfirmed. Grade C stations should be verified before closing schools. Contains modified Copernicus Atmosphere Monitoring Service information, via Open-Meteo.com (CC BY 4.0).

Open any flagged station: DOE against Open-Meteo on the same scale, plus a second-opinion closure chance:

same side of the trigger

1 flagged report for this station in the last 5 days (shaded). DOE reported exactly 158 for 15 hours in a row while Open-Meteo moved 30 points (possible stuck sensor or repeated value).

1 **Summary** – stations flagged in the last 5 days, closure-level readings the independent source does not support, possible under-reporting during haze, and how many stations are reliability A / B / C.

2 **Flagged report** – what happened, where and when. ACTIVE = still going on. Click to open the station. "Unconfirmed" is not "wrong": a 25 km model cannot see a single local source.

3 **Open-Meteo alone as a forecaster** – skill of the next-day closure forecast built only from the independent source, next to the DOE feed. It is weaker, which is why it is a second opinion, not a replacement.

4 **Chart** – DOE (orange) against Open-Meteo mapped to the DOE scale (blue dashed) with the range DOE normally falls in. Red shading = flagged hours.

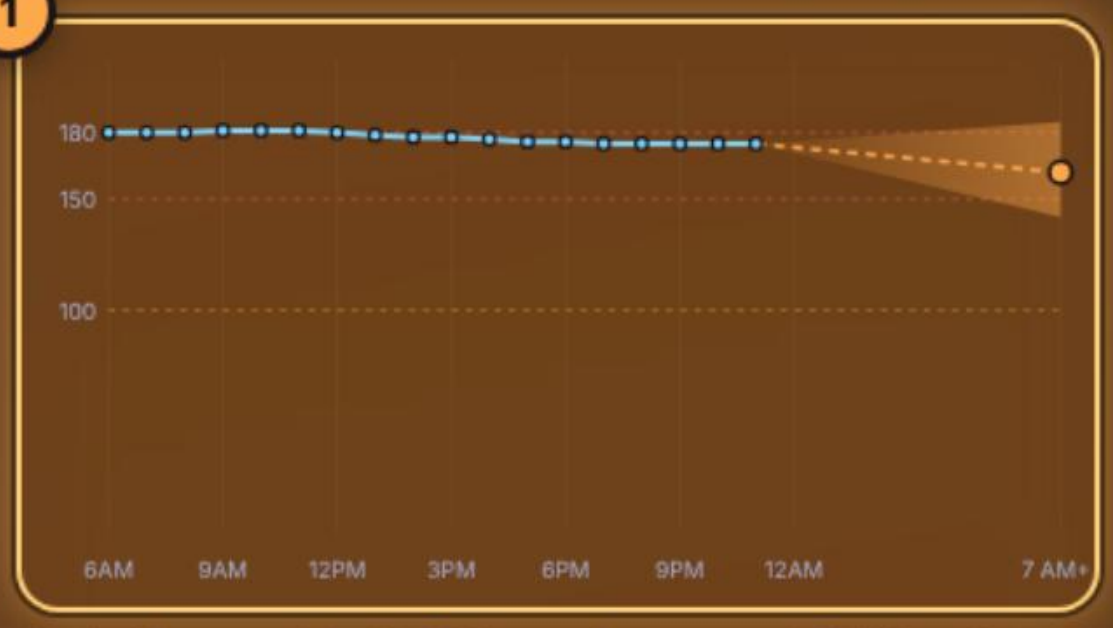

5 **Reliability grade** – A agrees closely · B usable · C verify before acting (large typical gap, poor band agreement, or high readings rarely corroborated).

6 **Second opinion** – closure chance from the DOE feed vs from Open-Meteo alone. Green frame = same side of the trigger; amber = they disagree, so verify.

The best announcement time reacts to your preferences

1

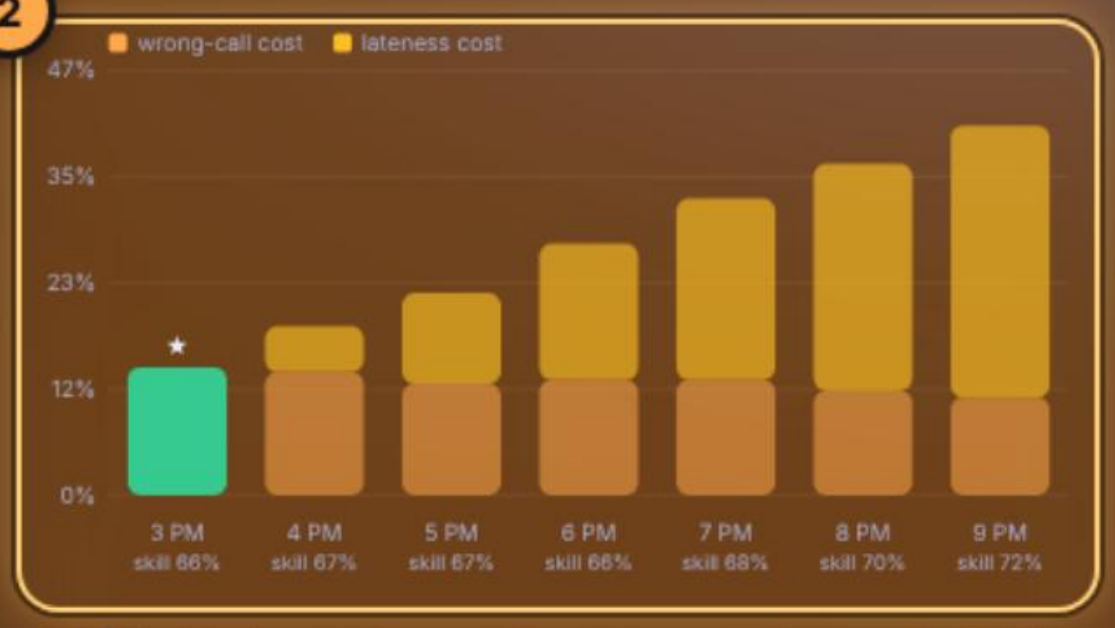

TODAY'S TREND → TOMORROW 7 AM

Dashed fan = model's 10–90% range for tomorrow's 7 AM reading (median 162).

2

BEST ANNOUNCEMENT TIME

★ 3 PM minimises total expected cost at your preferences (missed closure = 8× needless closure; each hour later = 5% of baseline). Click a bar to explore that hour in What-if.

Now drag "Cost of each hour later" from 5% to 0% (delay is free) – the ★ moves from the earliest hour to the latest:

DECISION PREFERENCES

Wrongly staying open costs × a needless closure **8**

3 ost of each hour later of baseline **0%**

4

BEST ANNOUNCEMENT TIME

★ 9 PM minimises total expected cost at your preferences (missed closure = 8× needless closure; each hour later = 0% of baseline). Click a bar to explore that hour in What-if.

1 **Trend + fan** – today's hourly API and the model's 10–90% range for tomorrow 7 AM.

2 **Cost bars** – wrong-call cost (missed closure vs needless closure) plus lateness cost for each candidate hour; ★ = cheapest. Click a bar to explore that hour.

3 **Decision preferences** (left panel) – how bad a missed closure is, and what each hour of lateness costs.

4 **Result** – with free delay the ★ moves to 9 PM because later hours forecast better; with costly delay the earliest hour wins.
